Bitmap layers An image layer, shown in Figure 11-2, is one of the basic elements of an image. It is a collection of pixels that work together to make up the overall image. Typically, each layer has been manipulated separately in Photoshop. **Figure 11-2:** Layers are the most fundamental building blocks of a Photoshop file. Layers are stored in separate areas of the file and can be edited individually. Typically, images have up to eight layers active at one time. This allows you to produce a composite image by applying colors, lighting effects, and other details to different parts of an image. The layer's name can change depending on the areas that you want to edit. For example, if you edit only the front of the image and then paint black into it, the _name_ of the layer will be Black.

Q: Using Mockito to test object with setter methods which return a value I have the following code. class MyClass { private MyDao myDao; public void setMyDao(MyDao myDao) { this.myDao = myDao; } public void doSomething() { //do stuff here this.myDao.updateStuff(); } @Override public boolean equals(Object obj) { MyClass other = (MyClass) obj; return other.myDao.updateStuff().equals(this.myDao.updateStuff()); } } My test class for this code is as follows @RunWith(JUnit4.class) public class MyClassTest { MyClass myClass; @Mock MyDao myDao; @Before public void setUp() { myClass = new MyClass(); } @Test public void testDoSomething() { Mockito.when(myDao.updateStuff()).thenReturn(true); MyClass myClass1 = new MyClass(); MyClass myClass2 = new MyClass(); myClass1.setMyDao(myDao); myClass2.setMyDao(myDao); assertTrue(myClass1.doSomething()); assertTrue(myClass2.doSomething()); Mockito.verify(myDao, times(1)).updateStuff(); } } Now I am using Mockito verifies to check for the method call. However, I am getting the

This invention relates to fluid couplings and, in particular, to a coupling of the type comprising a pair of rotatable parts, one of which is formed of elastomeric material and the other of which is rigid. Fluid couplings of this type generally consist of a rotatable assembly formed of a pair of cups with a resilient O-ring having a multiplicity of semi-cylindrical projections or keys engaged by axially extending slots in the exterior wall of one cup. These keys in turn are engaged by slots within the outer wall of the other cup. Such a coupling is shown in U.S. Pat. No. 3,796,595. Generally, the elastomeric member is mounted on the coupling by pressing it into the cup through the annular recesses which extend around the interior wall of the cup. The exterior peripheral edge of the elastomeric member is pulled through the slots in the sleeve to compress the keys in their mating slots. These elastomeric members have a disadvantage in that they are not readily fabricated. This is due to the fact that the fabrication of the keys, slots and annular recesses in the elastomeric member requires very close tolerances in order to insure that the keys fit properly in their slots. In some cases, the elastomeric member may be relatively easily made but this is true only if the projections on the keys are linear. This is the case in most machines which produce couplings by molding elastomeric members about the projections of an annular sleeve. In another case, the elastomeric member may be made by pressing the projections through a suitably shaped mold. In this case, however, the projections are shaped such that they require considerable force to insert them into the slots in the rigid member. In some cases, the elastomeric member is made separately and then pressed onto the coupling. This operation requires some care since the projections tend to deflect slightly in a radial direction from the center of the elastomeric member. As a consequence, unless the operator inserts the projections through the slots in the rigid member with extreme care, they may be misplaced to a sufficient extent as to cause leakage. It is a main object of the present invention to provide a fluid coupling of the character described which overcomes the problems and disadvantages mentioned above. Another object is to provide such a coupling in which the elastomeric member is made in a molding operation to assure the
